

# Produce Safety: Restaurant Safety Meeting Kit

## WHAT'S AT STAKE

Produce safety in a restaurant starts with sourcing high-quality fruits and vegetables from reputable suppliers. The produce should be inspected upon arrival, and any damaged or contaminated items should be discarded. The storage of produce should also be carefully managed to prevent cross-contamination with other foods or surfaces.

## WHAT'S THE DANGER

### HAZARDS ASSOCIATED WITH PRODUCE IN A RESTAURANT SETTING

- **Contamination:** Produce can become contaminated with harmful bacteria, viruses, or other pathogens during cultivation, harvesting, transportation, storage, or preparation. Contamination can occur from a variety of sources, including dirty hands, contaminated water, and unsanitary processing equipment.
- **Spoilage:** Produce can spoil quickly if it is not stored properly, which can lead to food waste and potential health hazards. Spoiled produce can also release harmful chemicals and toxins that can contaminate other food items.
- **Cross-contamination:** Cross-contamination can occur when bacteria or other pathogens are transferred from one food item to another. This can happen when produce is cut or prepared on the same cutting board or with the same knife as raw meat or poultry.
- **Allergies:** Some people have allergies or sensitivities to certain types of produce, such as peanuts, tree nuts, or soybeans. If these items are not properly labeled or segregated in a restaurant, customers with allergies could experience serious health problems.
- **Pesticide residues:** Some produce may contain pesticide residues that can be harmful if ingested in large quantities. It is important for restaurants to source produce from reputable suppliers and to wash and prepare it properly to minimize the risk of pesticide exposure.

## HOW TO PROTECT YOURSELF

### STEPS TO ENSURE PRODUCE SAFETY

- **Purchase produce from reputable suppliers:** The restaurant should purchase

produce from reputable and trusted suppliers. These suppliers should be certified and have a good track record of maintaining produce safety.

- **Properly store produce:** Proper storage of produce is essential to prevent spoilage and the growth of harmful bacteria. The restaurant should store produce in a cool, dry place, away from any potential contaminants.
- **Clean produce thoroughly:** It's important to wash produce thoroughly before using it in dishes. The restaurant should use clean, running water to wash produce and should use a scrub brush on firm produce, such as cucumbers and potatoes.
- **Use separate cutting boards and utensils:** To prevent cross-contamination, the restaurant should use separate cutting boards and utensils for produce and other food items.
- **Properly dispose of produce waste:** Proper disposal of produce waste is important to prevent the growth of harmful bacteria. The restaurant should dispose of produce waste promptly and properly in a closed container.
- **Train staff on proper handling:** The restaurant should train its staff on proper produce handling procedures, including washing, storage, and handling. Staff should also be trained on the signs of spoilage and how to recognize potentially contaminated produce.

## **BEST PRACTICES FOR RESTAURANT SAFETY**

- **Get the necessary training:** Start as a prep cook or kitchen assistant and work your way up.
- **Understand the menu:** Familiarize yourself with the restaurant's menu and cooking techniques.
- **Follow food safety guidelines:** Follow all food safety guidelines, including washing hands regularly, keep food at the correct temperature, and avoid cross-contamination.
- **Organize your workspace:** Keep your work area clean and organized.
- **Communicate with the team:** Collaboration is key in a restaurant kitchen. Communicate effectively with your fellow cooks, chefs, and servers to ensure that orders are prepared correctly and served on time.
- **Keep learning:** Stay up to date with new techniques and trends. Attend cooking classes, read industry publications, and experiment with new recipes in your free time to improve skills.

## **RESTAURANT FOOD SAFETY CHECKLIST**

- Prepare raw foods in an area that is separate from cooked foods.
- Use separate equipment for different food types like cutting boards and cutlery.
- Sanitize all work surfaces after they have been used for preparation.
- Store foods separately, such as placing raw chicken in plastic bags when thawing next to cooked meats.
- Ensure that all kitchen uniforms are laundered properly in an industrial washing machine.
- Ensure that employees wash their hands with hot, soapy water and dry thoroughly with paper towels after handling foods and after using the restroom.
- Feature a hygiene program in the employee handbook and in new employee training.
- Practice temperature monitoring to avoid cross contamination.
- Another way to keep your food and kitchen safe in addition to preparing food properly is to implement a food temperature monitoring process. When certain foods fluctuate outside of safe temperatures, they can become a breeding ground for harmful bacteria and other contaminants.
- Keep foods in the proper temperature range and never combine them with foods at improper temperatures. This can make a big difference when it comes to avoiding cross-contamination.

## **PRODUCE AND RESTAURANT SAFETY TAKEAWAYS**

Restaurant staff should also be trained in proper handling techniques to minimize the risk of contamination. This includes washing hands frequently, using clean cutting boards and utensils, and storing produce at the appropriate temperature to prevent the growth of harmful bacteria.

## **FINAL WORD**

Produce is an essential component in a restaurant, as it impacts the flavor, nutrition, presentation, reputation, and sustainability of the dishes served.
